

ERAM Radar Associate Software for Flight Data Processing and Radar Interface Requirements (Simulated).

Contractor will develop and provide a flight data processor software program that simulates as many ERAM EDST (Enroute Decision Support Tool) functions as possible.

The Computer Human Interface (CHI) must not contradict nor deviate from the entries made in ERAM/EDST. The expectation is tempered with realistic expectations; this does not have to be a perfect replication of ERAM/EDST, but achieve a training simulation environment where entries made by students result in appearance and functional response that simulates what would happen if it was real. The GPD flight data processing and trial planning should very closely resemble what occurs in ERAM/EDST per the description and appearance portrayed in the CBIs that we have provided.

It is vital that the radar display, position symbols, radar targets and data blocks be precisely the same or as near possible to EDST/DSR appearance. The EDST display and functionality (aircraft list, departure list, special posting area, alert columns, toolbars, voice communication indicators, embedded route text (ERT) and Graphic Plans Display (GPD) must be simulated with as near as possible to EDST employed by FAA and reproduced in similar software designs such as SOLO or SIGNAL.

Lesson Plans 43 and 46 along with the attached power-point files depict the appearance and interaction between flight data processing and radar data processing required for a successful training simulator that we are seeking. The CBIs (Computer Based Instruction) files we have provided depict the operating appearance and performance necessary to conduct medium to high fidelity training replication of EDST and radar interface.

Functionality must include: trajectory modeling, aircraft to aircraft/aircraft to air space conflict probe, FDP to RDP interface, route display, HALO, maneuver start point (probe climb/descent to LOA and normal rate of climb/descent, alert probe up to 20 minutes in the future.

Priority

1. Radar Display (maps, data blocks, lists) must conform to ERAM/DSR appearance as much as possible.
2. EDST Display must also conform in appearance as much as possible.
3. Alert columns must depict conflict probe of aircraft to aircraft and aircraft to airspace conflicts up to 20 minutes in the future.
4. Keyboard entry functionality should be the same as ERAM (Point-out protocol). PVDing a data block must be shown on EDST (Yellow then white).
5. Flight plan amendments and radar inputs should interface, i.e. an altitude amendment in the radar data block must send and show in EDST altitude columns.
6. EDST must provide trial planning of altitude changes. An altitude entry should show either RED/YELLOW or GREEN as trajectory modeling occurs.
7. Airspace is Aero Center, “Jackson Low” (Sector 66). See attached location identifiers that must be in the data base. See attached maps.
